Day 3: Task 1	5
Day 4: Task 1: Written.....	7
Day 4: Task 2: SQL Practical.....	13
Course Notes	37
Additional Information.....	Error! Bookmark not defined.

Day 1: Task 1

Please research and complete the below questions relating to key concepts of databases.

What is a primary key?	A primary key is a unique identifier for each record in a database table. It ensures that each record is distinct and cannot be duplicated.
How does this differ from a secondary key?	A secondary key (or alternate key) is any candidate key that is not selected as the primary key. It can still be used to access data but does not enforce uniqueness in the same way.
How are primary and foreign keys related?	A foreign key in one table is a reference to the primary key in another table. This establishes a relationship between the two tables, ensuring referential integrity.
Provide a real-world example of a one-to-one relationship	Each person has one passport, and each passport belongs to one person. The <i>Person</i> table and <i>Passport</i> table have a one-to-one relationship.
Provide a real-world example of a one-to-many relationship	A customer can place multiple orders, but each order is placed by only one customer. The <i>Customer</i> table is related to the <i>Orders</i> table in a one-to-many relationship.
Provide a real-world example of a many-to-many relationship	Students can enroll in many courses, and each course can have many students. This is typically modelled with a join table like <i>Enrolments</i> linking <i>Students</i> and <i>Courses</i> .

Day 1: Task 2

Please research and complete the below questions relating to key concepts of databases.

What is the difference between a relational and non-relational database?	<p>A relational database stores data in tables with rows and columns, like a spreadsheet. It's great for structured data with clear relationships—think customer orders or employee records—like a customer list where each row has a name, email, and phone number.</p> <p>Example: MySQL is a relational database used by many companies for managing transactions or user accounts.</p> <p>A non-relational database, on the other hand, stores data in more flexible formats like documents, key-value pairs, graphs, or wide-columns. It's better for handling unstructured or changing data (that doesn't fit neatly into tables), like user profiles, chat messages, or product catalogues.</p> <p>Example: MongoDB is a non-relational (NoSQL) database used for things like user profiles on a social media site, where every user might have different sets of information.</p>
What type of data would benefit off the non-relational model?	<p>Data that is unstructured, semi-structured, or constantly changing—like social media posts, multimedia files, sensor data, or user-generated content.</p> <p>Example: A product catalogue on an e-commerce site where each product has different attributes—like shoes with sizes, electronics with specs, or books with authors.</p> <p>Because non-relational databases are designed to be flexible, scalable, and can handle large volumes of data without needing a strict structure. They make it easier to adapt to changes in data format and are well-suited for big data and real-time applications.</p> <p>For Example, a messaging app like WhatsApp would benefit from a non-relational database to store messages, images, and user settings—all of which vary a lot.</p>

Day 3: Task 1

Please research the below ‘JOIN’ types, explain what they are and provide an example of the types of data it would be used on.

Self-join	<p>A self-join is a regular join but the table is joined with itself.</p> <p>Use Case: Used when rows in the same table need to be compared with each other.</p> <p>Example: In an <code>Employees</code> table, each employee has a <code>ManagerID</code> that references another employee in the same table.</p>
Right join	<p>Returns all rows from the right table and matched rows from the left table. Unmatched rows from the left table will have NULLs.</p> <p>Use Case: Useful when you want all records from the second table regardless of whether there's a match.</p> <p>Example: You want to list all <code>Products</code>, even if they don't have a <code>Sale</code>.</p>
Full join	<p>Returns all rows when there is a match in either left or right table. NULLs are filled in where there is no match.</p> <p>Use Case: Used when you want all records from both tables and to see what doesn't match.</p> <p>Example: Combining two client lists: one from online sales and one from in-store sales.</p>

Inner join	<p>Returns only the rows that have matching values in both tables.</p> <p>Use Case: Used to combine data where you only want results that exist in both tables.</p> <p>Example: Joining <code>Orders</code> and <code>Customers</code> to get only customers who placed orders.</p>
Cross join	<p>Also known as Cartesian Join- Returns the Cartesian product of both tables (every row of table A with every row of table B).</p> <p>Use Case: Used to generate combinations, like pairing every shirt size with every color.</p> <p>Example: Generate combinations of <code>ShirtSizes</code> and <code>Colors</code>.</p>
Left join	<p>Returns all rows from the left table and matched rows from the right table. Non-matching rows from the right will be <code>NULL</code>.</p> <p>Use Case: Used when you want to keep all records from the primary table, even if there's no match.</p> <p>Example: List all employees and their assigned projects (if any).</p>

Day 4: Task 1: Written

In your groups, discuss and complete the below activity. You can either nominate one writer or split the elements between you. Everyone however must have the completed work below:

Imagine you have been hired by a small retail business that wants to streamline its operations by creating a new database system. This database will be used to manage inventory, sales, and customer information. The business is a small corner shop that sells a range of groceries and domestic products. It might help to picture your local convenience store and think of what they sell. They also have a loyalty program, which you will need to consider when deciding what tables to create.

Write a 500-word essay explaining the steps you would take to set up and create this database. Your essay should cover the following points:

1. **Understanding the Business Requirements:**
 - a. What kind of data will the database need to store?
 - b. Who will be the users of the database, and what will they need to accomplish?
2. **Designing the Database Schema:**
 - a. How would you structure the database tables to efficiently store inventory, sales, and customer information?
 - b. What relationships between tables are necessary (e.g., how sales relate to inventory and customers)?
3. **Implementing the Database:**
 - a. What SQL commands would you use to create the database and its tables?
 - b. Provide examples of SQL statements for creating tables and defining relationships between them.
4. **Populating the Database:**
 - a. How would you input initial data into the database? Give examples of SQL INSERT statements.
5. **Maintaining the Database:**
 - a. What measures would you take to ensure the database remains accurate and up to date?
 - b. How would you handle backups and data security?

Your essay should include specific examples of SQL commands and explain why each step is necessary for creating a functional and efficient database for the retail business.

Setting Up a Database for a Small Retail Business:

1. Understanding the Business Requirements

To design an effective database, we first identify the core data the shop needs to manage:

Inventory Management

The system must track product entities with attributes such as `product_name`, `category`, `quantity_in_stock`, `unit_price`, and `supplier_id`. This enables inventory control and reorder management.

- *Example:* Milk – 10 units in stock, £1.50 per unit.

Transactional Data

Each sales transaction should be stored with a timestamp, foreign keys referencing sold products and customers, `quantity_sold`, and `total_amount`. This supports point-of-sale (POS) operations and sales analytics.

- *Example:* On 2025-01-15, sale of 2 units of Milk and 1 unit of Bread.

Customer Records

Customer data includes `customer_id`, `name`, `email`, `phone_number`, and `loyalty_points`. Loyalty tracking is tied to purchase activity for reward allocation.

- *Example:* Jane Doe, `jane.doe@example.com`, 50 loyalty points.

System Users

- **Cashiers:** Perform `INSERT` operations for sales and update inventory.
- **Managers:** Require `SELECT`, `UPDATE`, and reporting access.
- **Automated Processes:** Handle triggers for stock reduction and loyalty point updates.

This analysis ensures the database will support daily operations and customer engagement efficiently. This requirement analysis forms the foundation for a normalized and scalable database schema.

2. Designing the Database Schema

In a relational database, each table represents a distinct entity with defined attributes. For this retail system, the following tables are required:

Products Table- Stores all product-related data.

- **Columns:** `product_id` (PK), `product_name`, `category`, `price`, `stock_level`
- **Example Data:**
 - (1, 'Milk', 'Dairy', 1.50, 10)
 - (2, 'Bread', 'Bakery', 1.00, 20)

Customers Table- Stores customer details and loyalty data.

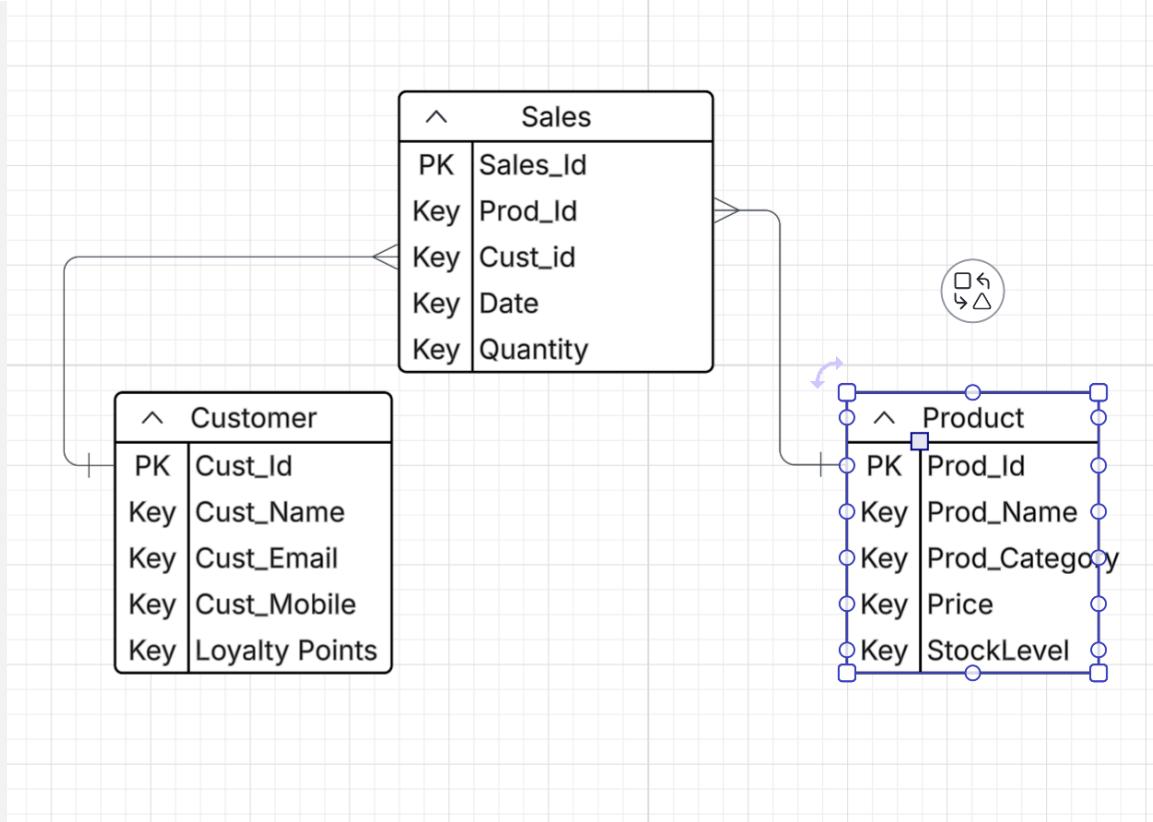

- **Columns:** `customer_id` (PK), `name`, `email`, `loyalty_points`
- **Example Data:**
 - (1, 'Jane Doe', 'jane.doe@example.com', 50)

Sales Table- Records transactions made by customers.

- **Columns:** `sale_id` (PK), `product_id` (FK), `customer_id` (FK), `sale_date`, `quantity`
- **Example Data:**
 - (1, 1, 1, '2025-01-15', 2)

LUCID CHART to show this Table Cardinality.

This schema supports efficient querying, normalization, and ensures referential integrity.

3. Implementing the Database

Create a New Database- In MySQL : allows you to define tables, fields, data types, and relationships between entities.

```
CREATE DATABASE RetailStore;
```

```
USE RetailStore;
```

Define Tables and Columns- Create the necessary tables with appropriate data types and constraints.

Products Table

```
CREATE TABLE Products (
```

```
    product_id INT AUTO_INCREMENT PRIMARY KEY,
    product_name VARCHAR(100),
    category VARCHAR(50),
    price DECIMAL(5,2),
    stock_level INT,
```

```

        supplier VARCHAR(100));

Customers Table
CREATE TABLE Customers (
    customer_id INT AUTO_INCREMENT PRIMARY KEY,
    name VARCHAR(100),
    email VARCHAR(100),
    loyalty_points INT DEFAULT 0);

Sales Table
CREATE TABLE Sales (
    sale_id INT AUTO_INCREMENT PRIMARY KEY,
    product_id INT,
    customer_id INT,
    sale_date DATE,
    quantity INT,
    FOREIGN KEY (product_id) REFERENCES Products(product_id),
    FOREIGN KEY (customer_id) REFERENCES Customers(customer_id));

```

4. Populating the Database

Once the database schema is created, data can be populated in two main ways:

Manual Data Entry Import from Excel or use the RDBMS interface (such as Microsoft Access datasheets or MySQL Workbench forms) to input records directly into tables.

```

INSERT INTO Products (product_name, category, price,
stock_level, supplier)

VALUES ('Milk', 'Dairy', 1.50, 10, 'Fresh Dairy Ltd.');

```

5. Maintaining the Database

a. Accuracy and Updates:

- Regular audits to verify stock levels.
- Scheduled updates after sales to decrease inventory and update loyalty points.
- Use of **UPDATE** and **DELETE** statements for data corrections.

b. **Backup and Security:**

- Automate daily backups using scripts or database tools.
- Restrict access using roles and permissions:

```
CREATE USER store_clerk IDENTIFIED BY 'securepass';  
GRANT SELECT, INSERT, UPDATE ON Sales TO store_clerk;
```

Conclusion

By systematically analyzing requirements, designing an efficient schema, implementing it using SQL, and planning for future maintenance, a small retail business can create a powerful database system.

Day 4: Task 2: SQL Practical

In your groups, work together to answer the below questions. It may be of benefit if one of you shares your screen with the group and as a team answer / take screen shots from there.

Setting up the database:

1. Download world_db(1)
2. Follow each step to create your database

For each question I would like to see both the syntax used and the output.

1. **Count Cities in USA:** *Scenario:* You've been tasked with conducting a demographic analysis of cities in the United States. Your first step is to determine the total number of cities within the country to provide a baseline for further analysis.

The screenshot shows the MySQL Workbench interface with the following details:

- Toolbar:** Includes icons for file operations (New, Open, Save, Print, Find, Copy, Paste, Undo, Redo), a search icon, and a refresh icon.
- Query Editor:** Displays the following SQL query:

```
1 •  SELECT COUNT(*) total_cities_in_USA
2   FROM City
3 WHERE CountryCode = 'USA';
```

A blue circular button with a white upward arrow is positioned below the query text.
- Status Bar:** Shows "100%" zoom level and a timestamp "27:3".
- Result Grid:** A table with one row labeled "total_cities_in_USA" containing the value "274".
- Action Output:** A table showing two log entries:

	Time	Action	Response
✓	10... 15:07:05	SELECT Name city_name, Countr...	51 row(s) returned
✓	10... 15:43:52	SELECT COUNT(*) total_cities_in...	1 row(s) returned

2. **Country with Highest Life Expectancy:** Scenario: As part of a global health initiative, you've been assigned to identify the country with the highest life expectancy. This information will be crucial for prioritising healthcare resources and interventions.

```
1 •  SELECT Name country_name, LifeExpectancy  
2   FROM Country  
3   ORDER BY LifeExpectancy DESC  
4   LIMIT 1;
```

The screenshot shows a database query interface with the following details:

- Query:**

```
1 •  SELECT Name country_name, LifeExpectancy  
2   FROM Country  
3   ORDER BY LifeExpectancy DESC  
4   LIMIT 1;
```
- Result Grid:** Shows the output of the query. The columns are "country_name" and "LifeExpectan...". One row is visible: Andorra, 83.5.
- Toolbar:** Includes zoom controls (30%), a refresh icon, a "Filter Rows" button, a search bar, an "Export" button, and a "Fetch rows" button.
- Log:** Shows the execution log with two entries:

Action	Time	Response
SELECT Name country_name, LifeExpectancy	15:58:58	239 Row(s) returned
SELECT Name country_name, LifeExpectancy	15:57:16	1 row(s) returned

3. "New Year Promotion: Featuring Cities with 'New' : Scenario: In anticipation of the upcoming New Year, your travel agency is gearing up for a special promotion featuring cities with names including the word 'New'. You're tasked with swiftly compiling a list of all cities from around the world. This curated selection will be essential in creating promotional materials and enticing travellers with exciting destinations to kick off the New Year in style.

```

1 •  SELECT Name city_name, CountryCode
2   FROM City
3 WHERE Name LIKE '%New%';

```

00% 12:1

Result Grid Filter Rows: Search Export:

city_name	CountryCode
Newcastle	AUS
Newcastle upon Tyne	GBR
Newport	GBR
Newcastle	ZAF
Kowloon and New Kowloon	HKG
New Bombay	IND
New Delhi	IND
Khanewal	PAK
New York	USA
New Orleans	USA
Newark	USA
Newport News	USA
New Haven	USA
New Bedford	USA

City 5

Action Output

Time	Action	Response
10... 10:57:10	SELECT Name city_name, CountryCode FR...	14 row(s) returned
10... 16:00:22	SELECT Name city_name, CountryCode FR...	14 row(s) returned

4. **Display Columns with Limit (First 10 Rows):** Scenario: You're tasked with providing a brief overview of the most populous cities in the world. To keep the report concise, you're instructed to list only the first 10 cities by population from the database.

The screenshot shows the MySQL Workbench interface with the following details:

- Query Editor:** Contains the following SQL code:

```
1 •  SELECT Name city_name, CountryCode, Population
2   FROM City
3 ORDER BY Population DESC
4 LIMIT 10;
```
- Result Grid:** Displays the top 10 rows of data from the query:

city_name	CountryCode	Population
Mumbai (Bombay)	IND	10500000
Seoul	KOR	9981619
São Paulo	BRA	9968485
Shanghai	CHN	9696300
Jakarta	IDN	9604900
Karachi	PAK	9269265
Istanbul	TUR	8787958
Ciudad de México	MEX	8591309
Moscow	RUS	8389200
New York	USA	8008278
- Timeline:** Shows two log entries:

Time	Action	Response
10:04:20	SELECT Name city_name, CountryCode, Po...	10 row(s) returned
16:04:59	SELECT Name city_name, CountryCode, Po...	10 row(s) returned

5. **Cities with Population Larger than 2,000,000:** Scenario: A real estate developer is interested in cities with substantial population sizes for potential investment opportunities. You're tasked with identifying cities from the database with populations exceeding 2 million to focus their research efforts.

```
1 • SELECT Name city_name, CountryCode, Population  
2   FROM City  
3 WHERE Population > 2000000  
4 ORDER BY Population DESC;
```

30% 26:4

Result Grid Filter Rows: Search Export:

City 12

Action Output

Time	Action	Response
10... 10:04:59	SELECT Name city_name, CountryCode, Po...	10 row(s) returned
10... 16:06:42	SELECT Name city_name, CountryCode, Po...	92 row(s) returned

6. **Cities Beginning with 'Be' Prefix:** Scenario: A travel blogger is planning a series of articles featuring cities with unique names. You're tasked with compiling a list of cities from the database that start with the prefix 'Be' to assist in the blogger's content creation process.

The screenshot shows the MySQL Workbench interface with the following details:

- Query Editor:** Contains the following SQL code:

```
1 • SELECT Name city_name, CountryCode
2 FROM City
3 WHERE Name LIKE 'Be%';
```
- Result Grid:** Displays the results of the query in a tabular format:

city_name	CountryCode
Béjaïa	DZA
Béchar	DZA
Benguela	AGO
Berazategui	ARG
Belize City	BLZ
Belmopan	BLZ
Belo Horizonte	BRA

10... 15:07:05		SELECT Name city_name, Countr...	51 row(s) returned

7. **Cities with Population Between 500,000-1,000,000:** Scenario: An urban planning committee needs to identify mid-sized cities suitable for infrastructure development projects. You're tasked with identifying cities with populations ranging between 500,000 and 1 million to inform their decision-making process.

The screenshot shows the MySQL Workbench interface with the following details:

- Query Editor:** Contains the following SQL code:

```

1 •  SELECT Name city_name, CountryCode, Population
2   FROM City
3 WHERE Population BETWEEN 500000 AND 1000000
4 ORDER BY Population DESC;
```
- Result Grid:** Displays the results of the query, showing 130 rows. The columns are city_name, CountryCode, and Population. Some rows are highlighted in light blue. The first few rows are:

city_name	CountryCode	Population
Amman	JOR	1000000
Mogadishu	SOM	997000

9. **Most Populated City:** *Scenario:* A real estate investment firm is interested in cities with significant population densities for potential development projects. You're tasked with identifying the most populated city from the database to guide their investment decisions and strategic planning.

```
1 •  SELECT Name city, CountryCode, Population  
2    FROM City  
3   ORDER BY Population DESC  
4   LIMIT 1;
```

10. **City Name Frequency Analysis: Supporting Geography Education Scenario:** In a geography class, students are learning about the distribution of city names around the world. The teacher, in preparation for a lesson on city name frequencies, wants to provide students with a list of unique city names sorted alphabetically, along with their respective counts of occurrences in the database. You're tasked with this sorted list to support the geography teacher.

```
1 •  SELECT Name city, COUNT(*)

- 11. City with the Lowest Population:** *Scenario:* A census bureau is conducting an analysis of urban population distribution. You're tasked with identifying the city with the lowest population from the database to provide a comprehensive overview of demographic trends.

12. Country with Largest Population: Scenario: A global economic research institute requires data on countries with the largest populations for a comprehensive analysis. You're tasked with identifying the country with the highest population from the database to provide valuable insights into demographic trends.

```
1 •  SELECT Name city, CountryCode, Population  
2   FROM City  
3   ORDER BY Population DESC  
4   LIMIT 1;
```

The screenshot shows a database query interface with the following details:

- Query:**

```
1 •  SELECT Name city, CountryCode, Population  
2   FROM City  
3   ORDER BY Population DESC  
4   LIMIT 1;
```
- Result Grid:** Displays the results of the query. The columns are labeled "city", "CountryCode", and "Population". The single row returned is: Mumbai (Bombay) | IND | 10500000.
- Action Output:** Shows the history of actions taken. It includes a log entry for the query execution: "10... 10:10:29 SELECT Name city, CountryCode, Population FROM City" and "10... 16:16:58 SELECT Name city, CountryCode, Population FROM City". Both entries show "1 row(s) returned".

13. **Capital of Spain:** Scenario: A travel agency is organising tours across Europe and needs accurate information on capital cities. You're tasked with identifying the capital of Spain from the database to ensure itinerary accuracy and provide travellers with essential destination information.

```
1 •  SELECT City.Name capital_city
2   FROM Country
3   JOIN City ON Country.Capital = City.ID
4 WHERE Country.Name = 'Spain';
```

The screenshot shows a database query interface with the following details:

- Query:**

```
1 •  SELECT City.Name capital_city
2   FROM Country
3   JOIN City ON Country.Capital = City.ID
4 WHERE Country.Name = 'Spain';
```
- Result Grid:** Displays the result of the query. The column is labeled "capital_city" and contains one row: "Madrid".
- Action Output:** Shows the history of actions taken. It includes two entries:

Action	Time	Response
SELECT City.Name capital_city FROM Country...	22:04:47	Error Code: 1054. UNKNOWN...
SELECT City.Name capital_city FROM Coun...	22:06:26	1 row(s) returned

14. Country with Shortest Life Expectancy: Scenario: A healthcare foundation is conducting research on global health indicators. You're tasked with identifying the country with the shortest life expectancy from the database to inform their efforts in improving healthcare systems and policies.

The screenshot shows a MySQL query editor interface. At the top, there is a toolbar with various icons for database management. Below the toolbar, a query window displays the following SQL code:

```
1 •  SELECT Name country_name, LifeExpectancy
2   FROM Country
3 WHERE LifeExpectancy IS NOT NULL
4 ORDER BY LifeExpectancy ASC
5 LIMIT 1;
```

Below the query window, there is a progress bar indicating the execution status. The main area shows the "Result Grid" with the following data:

country_name	LifeExpectancy
Zambia	37.2

At the bottom, the "Action Output" section shows the command history:

Action	Time	Response
SELECT Name country_name, LifeExpectancy...	22:11:49	1 row(s) returned
SELECT Name country_name, LifeExpectan...	10... 22:11:50	1 row(s) returned

15. **Cities in Europe:** *Scenario:* A European cultural exchange program is seeking to connect students with cities across the continent. You're tasked with compiling a list of cities located in Europe from the database to facilitate program planning and student engagement.

```
1  SELECT City.Name AS city_name, Country.Name AS country_n
2  FROM City
3  JOIN Country ON City.CountryCode = Country.Code
4  WHERE Country.Continent = 'Europe'
5  ORDER BY Country.Name, City.Name;
```

10... 22:33:16	SELECT City.Name AS city_name, Country....	841 row(s) returned

16. Average Population by Country: Scenario: A demographic research team is conducting a comparative analysis of population distributions across countries. You're tasked with calculating the average population for each country from the database to provide valuable insights into global population trends.

The screenshot shows a database interface with a query editor, result grid, and action output log.

Query Editor:

```
1 •  SELECT CountryCode, AVG(Population) AS Average_Population
2   FROM city
3   GROUP BY CountryCode;
```

Result Grid:

CountryCode	Average_Population
ABW	29034.0000
AFG	583025.0000
AGO	512320.0000
AIA	778.0000
ALB	270000.0000
AND	21189.0000
ANT	2345.0000
ARE	345667.2000
ARG	350816.8947
ARM	544366.6667
ASM	3761.5000
ATG	24000.0000
AUS	808119.0000
AUT	397378.8333
AZE	616000.0000
BDI	300000.0000

Action Output:

Action	Time	Response
SELECT CountryCode, AVG(Population) AS...	22:09:10	232 row(s) returned
SELECT CountryCode, AVG(Population) AS...	22:40:29	232 row(s) returned

17. Capital Cities Population Comparison: Scenario: A statistical analysis firm is examining population distributions between capital cities worldwide. You're tasked with comparing the populations of capital cities from different countries to identify trends and patterns in urban demographics.

The screenshot shows a database interface with a SQL query editor at the top and a results grid below. The query retrieves the names of countries, their capital cities, and the populations of those capitals, ordered by population in descending order. The results grid displays 232 rows of data, and the history panel at the bottom shows two log entries for the execution of the query.

```
1 •  SELECT Country.Name AS country_name, City.Name AS capital_city, City.Population AS capital_population
2   FROM Country
3   JOIN City ON Country.Capital = City.ID
4   ORDER BY City.Population DESC;
```

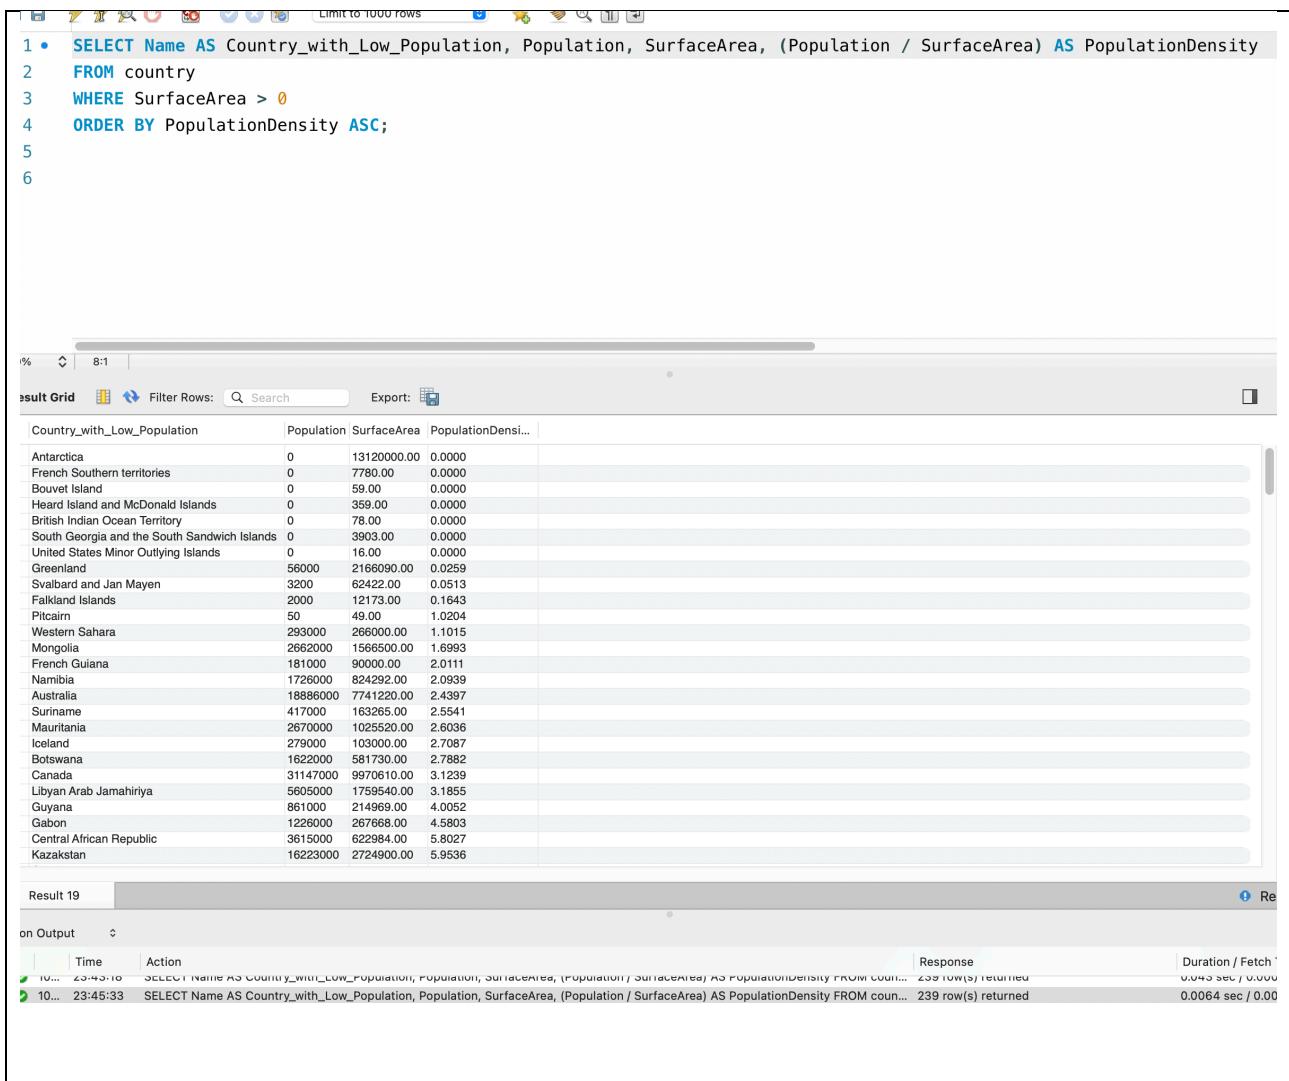

country_name	capital_city	capital_population
South Korea	Seoul	9981619
Indonesia	Jakarta	9604900
Mexico	Ciudad de México	8591309
Russian Federat...	Moscow	8389200
Japan	Tokyo	7980230
China	Peking	7472000
United Kingdom	London	7285000
Egypt	Cairo	6789479
Iran	Teheran	6758845
Peru	Lima	6464693
Thailand	Bangkok	6320174
Colombia	Santafé de Bogotá	6260862
Congo, The Dem.	Kinshasa	5064000
Chile	Santiago de Chile	4703954
Iraq	Baghdad	4336000
Singapore	Singapore	4017733
Bangladesh	Dhaka	3612850
Germany	Berlin	3386667
Myanmar	Rangoon (Yangon)	3361700
Saudi Arabia	Riyadh	3324000
Turkey	Ankara	3038159
Argentina	Buenos Aires	2982146
Spain	Madrid	2879052
Italy	Roma	2643581
Taiwan	Taipei	2641312
Ukraine	Kyiv	2624000

Result 15

Action	Time	Response
1... 29-33:00	SELECT Country, City, City.Population FROM Country JOIN City ON Country.Capital = City.ID ORDER BY City.Population DESC LIMIT 0, 1...	ERROR CODE: 1054: UNKNOWN COLUMN 'Country'
10... 23:33:38	SELECT Country.Name AS country_name, City.Name AS capital_city, City.Population AS capital_population FROM Country JOIN City ON...	232 row(s) returned

18. Countries with Low Population Density: Scenario: An agricultural research institute is studying countries with low population densities for potential agricultural development projects. You're tasked with identifying countries with sparse populations from the database to support the institute's research efforts.

The screenshot shows the MySQL Workbench interface with the following details:

- SQL Editor:** Displays the query:

```
1 • SELECT Name AS Country_with_Low_Population, Population, SurfaceArea, (Population / SurfaceArea) AS PopulationDensity
2   FROM country
3   WHERE SurfaceArea > 0
4   ORDER BY PopulationDensity ASC;
5
6
```
- Result Grid:** Shows the output of the query as a table with columns: Country_with_Low_Population, Population, SurfaceArea, and PopulationDensi... (truncated).
- Results:** The table contains 239 rows of data, listing various countries with their names, populations, surface areas, and calculated population densities.
- Logs:** The bottom section shows the execution logs with two entries:
 - 10... 23:43:10 SELECT Name AS Country_with_Low_Population, Population, SurfaceArea, (Population / SurfaceArea) AS PopulationDensity FROM country... 239 row(s) returned
 - 10... 23:45:33 SELECT Name AS Country_with_Low_Population, Population, SurfaceArea, (Population / SurfaceArea) AS PopulationDensity FROM coun... 239 row(s) returned

19. Cities with High GDP per Capita: Scenario: An economic consulting firm is analysing cities with high GDP per capita for investment opportunities. You're tasked with identifying cities with above-average GDP per capita from the database to assist the firm in identifying potential investment destinations.

```

1 •  SELECT City.Name AS city_name, Country.Name AS country_name, Country.GNP, Country.Population,
2   (Country.GNP / Country.Population) AS gdp_per_capita, City.Population AS city_population
3   FROM City
4   JOIN Country ON City.CountryCode = Country.Code
5   WHERE Country.Population > 0
6   AND Country.GNP IS NOT NULL
7   AND (Country.GNP / Country.Population) > (SELECT AVG(GNP / Population) FROM Country WHERE Population > 0 AND GNP IS NOT NULL)
8   ORDER BY gdp_per_capita DESC;

```

The screenshot shows a database query results interface. At the top, there is a code editor with the SQL query provided. Below it is a results grid titled "Result Grid" with columns: city_name, country_name, GNP, Population, gdp_per_capita, and city_population. The results list various cities and their corresponding data. At the bottom, there is a "Log" section showing the execution details, including the time (23:54:53), action (SELECT query), response (1000 row(s) returned), duration (0.003 sec / 0.003 sec), and error count (0).

city_name	country_name	GNP	Population	gdp_per_capita	city_population
Luxembourg [Luxemburg/Létzburg]	Luxembourg	16321.00	435700	0.037459	80700

Result 3

Action Output

Time	Action	Response	Duration / F
23:54:53	SELECT City.Name AS city_name, Country.Name AS country_name, Country.GNP, Country.Population, (Country.GNP / Country.Population) AS gdp_per_capita, City.Population AS city_population	1000 row(s) returned	0.003 sec / 0.003 sec
23:54:53	SELECT City.Name AS city_name, Country.Name AS country_name, Country.GNP, Country.Population, (Country.GNP / Country.Population) AS gdp_per_capita, City.Population AS city_population	1000 row(s) returned	0.003 sec / 0.003 sec

20. Display Columns with Limit (Rows 31-40): Scenario: A market research firm requires detailed information on cities beyond the top rankings for a comprehensive analysis. You're tasked with providing data on cities ranked between 31st and 40th by population to ensure a thorough understanding of urban demographics.

The screenshot shows the MySQL Workbench interface. At the top, there's a toolbar with various icons. Below it, a query editor window displays the following SQL code:

```
1 •  SELECT Name AS city_name, CountryCode, Population
2   FROM City
3   ORDER BY Population DESC
4   LIMIT 10 OFFSET 30;
```

The result grid below the code shows the following data:

city_name	CountryCode	Population
Shenyang	CHN	4265200
Kanton [Guangzhou]	CHN	4256300
Singapore	SGP	4017733
Ho Chi Minh City	VNM	3980000
Chennai (Madras)	IND	3841396
Pusan	KOR	3804522
Los Angeles	USA	3694820
Dhaka	BGD	3612850
Berlin	DEU	3386667
Rangoon (Yangon)	MMR	3361700

A message "City 30" is displayed above the result grid. Below the grid, the "Action Output" section shows two log entries:

Action	Time	Response	Duration
SELECT Name AS city_name, CountryCode...	23:58:20	10 row(s) returned	0.0073 s
SELECT City.Name AS city_name, Country....	23:59:44	10 row(s) returned	0.0083 s

Course Notes

It is recommended to take notes from the course, use the space below to do so, or use the revision guide shared with the class:

We have included a range of additional links to further resources and information that you may find useful, these can be found within your revision guide.

END OF WORKBOOK

Please check through your work thoroughly before submitting and update the table of contents if required.

Please send your completed work booklet to your trainer.
